                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at least one fitalion phage library from the peripheral blood hypphocytes (PBLS) of a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured tumour cells of the same type as the patient's tumour; (c) removing extraneous antibodies by absorption against normal human cells; (d) cloning the phage salected in step (b) and (c); (e) assaying the specificity of the cloned phage by incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that colline of cultured normal cells in further binding assays to either cell line of cultured normal cells in further binding assays of cultured unmour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy chain antibodie, from an screw antibodies produced can be used for a method as described above The antibodies produced can be used for a method as described above The antibodies produced can be used for antigens for studying tumourigenesis or for use as anti-cancer vaccines. The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MABs). Since the antibodies are isolated from common cell line can be improved by genetic manipulations.

DNA encoding complementary determining regions - of human anti-rhesus D antibodies, useful in prodn. of monoclonal anti-rhesus D antibodies, useful in prodn. of monoclonal antibodies and for passive indumination Disclosure, Fig 14, 32pp. English.

The DNA sequence of eleven monoclonal antibodies are represented in 0.19145-57. Synthetic genes, for both heavy and light chains may be created by combining selected CDP 1, 2, and 3 regions, which may be selected from different antibody mols. Having varied binding specificity. The chimaeric anti-Rhb antibodies can be used in dargnesis and therapy, and are capable of providing blood-typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 ggvvqpgrslrlscaasgftfssygmhwvrqapgkglewvaviwydgsnkyyadsvkqrf 60

per was used too prepare a human scrot library from RNA from white per was used too prepare a human scrot library from IgG and blood cells from an unimumulsed donor. Heavy chains from IgG and blood cells from an unimumulsed donor. Heavy chains from IgG and IgG and antibodies were amplified separately. Four separate libraries were generated (IgG**, IgG-lambda, IgW** and IgW*-lambda). The curie contains were then subjected to affinity selection for binding to phox:BSA by selection on tubes followed by analysis by ELISA. Of these were designated BSA binders. Thirteen of fourteen clones sequenced had the same sequence, the VH derived from a human VH3 sequenced had the same sequence, the VH derived from a human VH family qene (RA2572). The other was derived from a human VH4 family qene and a human VK1 family gene. One clone bound only to phox:BSA and a human VK1 family gene (RA2574) and VL from a human VH4 family qene (RA2574). This sequence revealed a VH derived from a human VK1 family gene (RA2576) and VL from a human V lambda 1 family gene (RA2570). The other was derived from a human VH4 family gene (RA2570). The other was lambda from a human VH4 family gene (RA2570) and VL from a human V lambda I family gene (RA2570).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 qvqlvqsgggvvqpgrslrlscaasgftfssygmhwvrqapgkglewvavisydgsnkyy 60

therapeutic efficiency by presenting human surface on V-region

Example 1; Fig 4B; 230pp; English.

Modification of a rodent antibody (Ab) or fragment by resurfacing in

order to produce a humanised rodent Ab can be determined by calculating

context to produce a humanised rodent Ab can be determined by calculating

context to produce a humanised rodent Ab can be determined by calculating

context to produce a humanised rodent Ab can be determined by calculating

context to produce a humanised rodent Ab can be determined antibody surfaces. In order to test

context to produce a humanised rodent Ab can be determined by calculating approach

using most similar chain; and (3) resurfacing approach using human

context to a sequence which may a similar surface residues. The Ab used was the mutine

anti-N901 Ab (see R52064). Experiment 2 was carried out using the present

context to prepd. by congressing with anti-N901 Ab. N901/G36055 (MS2065) was

prepd. by congressing sequence numbering starts at 118 in the

specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Agent contg. antigen-binding domain of human antibody to transforming growth factor beta 1 or 2 - and nucleic acid encoding transforming growth factor beta 1 or 2 - and nucleic acid encoding transforming growth factor beta 1 or 2 - and nucleic acid encoding transforming disease.

Tit used to neutralise effects of TGP, e.g. for control of fibrosis, contain 16; Fig la(i); 184pp; English.

from the human monoclonal antibody (MAb) PEI-1. The MAb was generated from the human monoclonal antibody (MAb) PEI-1. The MAb was generated by immunising humans with a hepatitis B virus (HBV) vaccine, isolating by immunishing humans with a hepatitis B virus (HBV) vaccine, isolating by propered cell line Spa2-4. 5 cell lines were isolated PEI-1, ZMI-1, Xml-2, MD3-4 and LO3-3. The cell lines were then tested for production of a nati-hepatitis B virus surface antigen antibody by ELISA. The MAbs care then purified from large scale cell culture by protein A care then purified from large scale cell culture by Protein A care then burnatography, size separation on Sephacryl S300 gel and ion exchange chromatography on Q-sepharose. The heavy and light chains of the MAbs canerated and used to amplify cDNA synthesised from RNA purified from generated and used to amplify cDNA synthesised from RNA purified from call horidom cell line. The sequences of the heavy and light chains of (nucleic acid and amino acid) from MAbs PEI-1, ZMI-1, ZMI-2 and MD3-4 are conclusing a mimmunosuppressed patients or peu used to treat HBV increasing the conclusion of the heavy in the chains of the heavy in the chains of the heavy in manuscuppressed patients or peutients with chronic active conclusion of the conclusion of t

for diagnosis and treatment differentials by Functional antibodies active addition in the monoclonal antibodies active addition in the monoclonal antibodies and treatment of Hepatitis B virus Example: Page 35: 53pp; English.

Chuman volunteers were immunised with hepatitis B vaccine. MD3-4, ZM1-1 and PE1-1 hybridoma cell lines were derived from 1 ymphocytes of individuals immunised with Heptavax (Merck 6 Co).

Chribodies PE1-1, ZM1-1, MZ1-2 and MD3-4 belong to the 1963 class.

The cell lines producing PE1-1, ZM1-1 and ZM1-2 were deposited as The cell lines producing PE1-1, ZM1-1 and ZM1-2 were deposited as Troches as typical (mouse x human) x human hybridomas and produce their espective Abs in concs. ranging up to 25 mq/1 in standard chains of Abs PE1-1, ZM1-1 and MD3-4 were isolated and chains of Abs PE1-1, ZM1-1 and MD3-4 were isolated and chains of Abs PE1-1, ZM1-2 and MD3-4 were isolated and chains of Abs PE1-1, ZM1-2 and MD3-4 were isolated and cannot be concerned and class and objected from 10(7) hybridoma cells of each cell line. Ss DNA was synthesised using AMV-reverse and objected amplified DNA was size as primer. PCRs were performed and amplified DNA was size as primer. PCRs were performed and amplified DNA was size as primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20 gvglvesgggyvgpgrslrlscaasaftfsrygmhwvrgapykglewvavisydgsnkwy 79

New engineered antibodies and fusion proteins for preventing plasmodium infection - contg. murine antibody CDR sequences, an corresp. nucleic acid, vectors and transformed cells Claim 14; Fig 9; 98pp; English.

Example 4 describes the prodn. of a high affinity humanised antibody. At amino acid position 49, the Ser of the humanised heavy chain Phizhro-3 was changed to Ala, which is the amino acid found at this position in the native murine NSF2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 674; DB 9; Length 122; Pred. Stimulating prodn. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination bisclosure: page 66: 130pp: English a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH; sepecially VH3, restricted Abs. During attempts to identify sAgs, as sequences (FS4784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (F74802:), Qf4402-56) of VH regions of SpA binders obtained from combinatorial libraries were determined. IgM protein 18/2 derives from the germline configuration of VH gene

Naturally-occurring (Q4484.42) and synthetic (Q44825.28) variable light chaim and variable heavy chaim sequences deribable chaim and variable heavy chaim sequences its variable chaim peptides, CDRS, functional fragments, Fab fragments, and analogs are useful in prodm. of fusion proteins, esp. engineered antibodies. These prods. are used to protect humans against plasmodium infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New engineered antibodies and fusion proteins for preventing

rrom a cancer pattern.

A process for isolating and synthesising human monoclonal anti-tumour can include as been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes (c) the phage library in a binding assay with cultured tumour cells of the the phage library in a binding assay with cultured tumour cells of the construction against normal human cells: (d) cloning the phage selected in absorption against normal human cells: (d) cloning the phage selected in absorption against normal human cells: (d) cloning the phage selected in absorption against normal human cells: (d) cloning the phage by step (b) and (c); (e) assaying the specificity of the cloned phage by ind (d) further testing the specificity of cloned phage by considering the phage with at least two types of cultured normal cells: (d) cloned phage the or cultured tumour cells derived from more than one other tumour that is to cultured tumour cells derived from more than one other tumour that is to cultured tumour cells derived from more than one other tumour cells derived from sold for isolating tumour cells derived from season sequence contains and for sudding tumour cells and therapeutic applications and for isolating tumour can the monoclonal antibodies Mabs). Since the antibodies are isolated fumour cell line can be improved by genetic manipulations.

C from fusion phage libraries, their affinity and specificity for a cultumour cell line can be improved by genetic manipulations.
                                                                                                                                                                                                                                                       ..

This sequence is derived from the nucleotide sequence encoding the heavy chain variable region. The "x" residues represent nonsense codons. The coding sequence has been translated in all 3 reading frames (see also R1212 and R12133).

                                                                                                                                                                                                                                                                                                                                        The sequence represents the variable heavy chain segment of a human monoclonal antibody (HuMAb) against interleukin-1-alpha. The MAb is of subclass 1964 and binds to lymphokines/monokines with an affinity of 10(9)/M. The Mab or fragment (FV, single-chain FV, Fab or F(ab') is used in the treatment of inflammation e.g. rheumatoid arthritis, osteoarthritis and inflammatory bowel diseases, and in the treatment or psortial inflammatory bowel diseases, and in disease and tumours. The MAb or fragment can also be used for

Example 13: Figure 11A: 116pp; English.

Example 13: Figure 11A: 116pp; English.

Example recombinant DNA molecule which encodes a single chain fusion protein or antibody comprising the FV region of both the light and heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion protein or Ab has the binding specificity of monoclonal Ab (MAb) B1, B3 or B5, can be used for the production of such fusion proteins or antibodies. The fusion proteins can be used in compositions as an immunictoxin to inhibit tumour cell growth the single chain antibody can be used to detect the presence or The single chain antibody can be used to detect the presence or patient. The antibodies are also useful as multiple targetting moleties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the imaging of tumours tumours. Humanised antibodies are less immunogenic than the mouse the mouse also be used to a radiolabel and for the pathological diagnosis of tumours. Humanised antibodies are less immunogenic than the mouse make the first pathological diagnosis of the first pathological contains the mouse of the first pathological contains the mouse the first pathological contains the mouse first pathological contai

Claim 16; Fig la(ii); 184pp; English.

This polypeptide comprises the VH domain of human screw antibody which is specific for transforming arouth factor (TGF)

beta-1. It is encoded by a gene (T66381) isolated from a large beta-1. It is encoded by a gene (T66381) isolated from a large content beta-1. It is encoded by a gene (T66381) isolated from a large content beta-1. The antigen-binding domains of human content the adverse effects of TGF beta, such as (i) promotion to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or Keloid scarring, lung fibrosis, cofficial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrbosis, scleroderma, mycoardial infarction, post-angioplasty restensis, scleroderma, comparate disorders, cataract, glaucoma, or esp. neural scarring and glomenionephritis, also (not claimed) osteoporosis), or (ii) immune and inflammatory diseases (e.g. rheumator) artificial colds encodain antibody VH and VL can be used for prodn. of recombinant antigen-binding domains. These are highly compared to specific, have low dissociation constants (pref. less than 5 nM) sequence 123 AA; sequence 123 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 adsvkgrftisrdnskntlylgmnslraedtavyycartge-ysgydtsg-velwgggtt 118

Four separate libraries were generated (19G-K, 19G-lambda, 19M-K and 19M-lambda). The purified scFv fragments were ligated into the phagemid pilms! for purified scFv fragments were ligated into the phagemid pilms! for prepression on the surface of id bacteriophage as quene [1] instons. The clones were then subjected to affinity selection for binding to phox:BSA by selection on tubes followed by analysis by ELISA. Of

Heavy chain VH3.5 from BSA binding scFv fragment.
Heavy chain VH3.5 from BSA binding scFv fragment; coat;
Fd; bacteriophage, gene III; llamentous; phagemid; capsid; coat;
pilus; g3p; binding; adsorption; gene VIII; diverse repertoire;
specific binding pairs; replicable genetic display package; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        wccafferty J, Pope AR, Johnson KS, Hoogenboom HKJ, Griffills AD: Jackson RH, Holliger KP, Marks JD, Clackson TP, Chiswell DJ: Winter GP, Bonnert TP;

Method of resurfacing of rodent antibodies to produce humanised antibody forms - for producing non-human antibodies with improved therapeutic efficiency by presenting human surface on V-region Example 1, Fig 4B, 230pp; English.

Modification of a rodent antibody (Ab) or fragment by resurfacing in order to produce a humanised rodent Ab can be determined by calculating homology between murine and human Ab antibody surfaces. In order to test the resurfacing approach of the invention, three humanisation experiments were set up: (1) traditional loop grafting (2) resurfacing approach using most similar chain; and (3) resurfacing approach using human sequences with most similar surface residues. The Ab used was the murine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  anti-N901 Ab (see R52064). Experiment 2 was carried out using the present sequence which represents the human G36005 Ab heavy chain variable present with 89 percent homology with anti-N901 Ab N901/355005 (P52055) was prepding Sequence numbering starts at 118 in the specification.
                                                                                                                                                                                                                                                                                                                                     1 qvqlvqsqgg...qpgrslrlscaasgftfssygmhwvrqapgkglewvavisydgsnkyy 60

96 clones analysed, 43 showed binding to both phox:RSA and BSA. These were designated BSA binders. Thirteen of fourteen clones sequenced had the same sequence, the VH derived from a human vH3 family gene (Shown here) and the VL from a human vH4 family gene (R2552). The other was derived from a human vH4 family gene one chone bound only to phox:BSA (oxazolono bindin) in this sequence revealed a VH derived from a human vH1 family gene (R22569) and VL from a human v lambda I family gene (R2250). Example 8: Column 15-18: 25pp; English.

This is the amino acid sequence of the heavy chain variable (Vh) region this is the amino acid sequence of the heavy chain variable (Vh) region from the human monoclonal antibody (MAD) PEI-1. The MAD was generated by immunising humans with a hepatitis B virus (HBV) vaccine, isolating peripheral, blood lymphocytes (PBL) and fusing them with a mouse/human xenogeneic cell line SPAZ-4. 5 cell lines were isolated? PEI-1, ZMI-1, ZMI-2, MAD-3.4 and LO3-3. The cell lines were then tested for production of an anti-hepatitis B virus surface antigen antibody by ELISA The MADs are then purified from large scale cell culture by protein A chromatography, size separation on Sephacryl S300 gel and ion exchange
                                                                                                                                                                                                                                                                                                                                                                               08-DEC-1997 (first entry)

Them a contect partient.

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes (PBLs) of a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured 'uncour antibodies in same type as the patient's tumour; (c) removing extraneous antibodies by absorption against normal human cells; (d) cloning the phage selected in steep (b) and (c); (e) assaying the specificity of the cloned phace by incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that do not bind to either cell line of cultured normal cells in further that do not bind to cultured tumour cells derived from more than one other tumour that is not the patient's tumour. The present sequence represents a human heavy
chromatography on Q-Sepharose. The heavy and light chains of the Mabs were isolated and their amino acid sequences determined. Primers were generated and used to amplify cDNA synthesised from RNA purified from acach bypridoma cell line. The sequences of the heavy and light chains (nucleic acid and amino acid) from Mabs PEI 1, 2Ml 1, 2Ml-2 and MNS-4 shown in 185838-45 and W24944-91. The Mabs are he used to treat HBV infections in immunosuppressed patients or patients with chronic active hepatifis, especially liver transplant patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antigens for studying tumouriquesis or for use as anti-cancer vaccines. The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            not the patient's tumour. The present sequence represents a human heavy chain antibody, from an scrv antibody lusion phage library, produced by a method as described above. The antibodies produced can be used for a method as described above. The antibodies produced can be used for diagnostic and therapeutic applications and for solating tumour parcines.

MD3-4, ZM1-2, ZM1-1 and PE1-1 hybridoma cell lines were derived from lymphocytes of individuals immunised with Heptavax (Merck & CO).

Antibodies PE1-1, ZM1-1, M21-2 and MD3-4, belong to the IgG1 cias.

Antibodies PE1-1, ZM1-1, M21-2 and MD3-4, belong to the IgG1 cias.

The cell lines producing PE1-1, ZM1-1 and ZM1-2 were deposited as AFC FM924, 9191 and 9192 respectively. The cell lines all behave as typical (mouse x human) x human hybridomas and produce their respective Abs in concs. ranging up to 25 mg/l in standard suspension culture. The heavy variable (VH) and light variable (LH) sequenced. Total RNA was extracted from 10(7) hybridoma cells
